

## Baguette

A baguette diamond is a study in precision, an elongated, rectangular cut with straight or tapered sides and step facets that emphasize clarity and geometry over brilliance. First popularized in the Art Deco era, baguettes are often used as accents, their clean lines framing larger stones or creating sleek, continuous bands of light.

Mined in diamond-rich regions such as South Africa, Botswana, Russia, and Canada, these diamonds are chosen for their purity and structural elegance. Their appeal lies in their restraint: rather than scattering light into a kaleidoscope, they reflect it in long, deliberate flashes, more like sunlight on glass than fire from a flame.

### **The Story Behind Arun's Fascination for the Diamond : Baguette**

For Arun, the baguette diamond is the language of architecture spoken in light. Its parallel facets and disciplined form give it the feel of a well-drawn line, a structural element that can guide the eye or define a boundary in a design. He admires its ability to add rhythm without noise, to bring order without dulling the emotion of the piece. When selecting baguette diamonds, Arun looks for perfect proportion, crisp facet junctions, and exceptional clarity, knowing that the step cut leaves no place for imperfections to hide. He chooses stones that carry an almost architectural poise, where each facet works like a pane in a finely built window.

In an Arunashi creation, baguette diamonds are never just supporting players, they are the scaffolding that holds the story together. To Arun, they are proof that not all beauty comes from excess; sometimes it's the straightest line that leads to the most elegant curve.
