

## Diamond Cadillac Cut

The diamond Cadillac cut is a unique, modern fancy cut that resembles the tailfin silhouette of the iconic Cadillac car from the mid, 20th century. Triangular at its base with two elongated sides and an angled top, it has a sleek, futuristic symmetry. Typically used as a side stone, its geometry makes it both directional and architectural, like an arrow of light.

Sourced from the major diamond centers of South Africa, Botswana, Russia, and Canada, diamonds cut in this style are chosen for their clarity and brilliance, ensuring the shape enhances rather than diminishes their natural fire.

### **The Story Behind Arun's Fascination for the Diamond : Cadillac Cut**

For Arun, the diamond Cadillac is not just a cut, it is motion crystallized. Its geometry feels less like a static shape and more like an idea caught mid, flight. He is fascinated by its ability to suggest direction, speed, and transformation, all while retaining the timeless purity of diamond.

When selecting Cadillac cuts, Arun looks for proportion and symmetry that heighten the sense of movement, stones that don't just reflect light, but propel it forward. He values how the cut resists convention, preferring to lean toward the dramatic and the architectural.

In an Arunashi creation, the diamond Cadillac becomes a gesture of momentum, a shard of energy in dialogue with more classical forms. To Arun, it is proof that diamond need not always be about permanence; sometimes, it can be about motion, an arrow of brilliance pointing toward the future.
