

Round Full Cut

The round full cut diamond, known widely as the round brilliant, is the most iconic and scientifically refined cut in the diamond world. With 57 or 58 precisely arranged facets, it was engineered to maximize light performance, balancing brilliance (white light return), fire (color dispersion), and scintillation (flashes of light in motion).

Found in leading diamond sources such as South Africa, Botswana, Canada, and Russia, the round full cut has become the global standard of perfection in both beauty and proportion. Its geometry is not accidental, it is mathematics made radiant, where every angle works in harmony to release light.

The Story Behind Arun's Fascination for the Diamond : Round Full Cut

For Arun, the round full cut diamond is the archetype of clarity and brilliance, the gemstone that embodies the very idea of light captured. He is fascinated not just by its perfection, but by its history: centuries of experimentation and craftsmanship distilled into a single form that feels inevitable, as though the diamond itself had always wanted to be cut this way.

When choosing round full cut diamonds, Arun searches for stones where light moves cleanly and endlessly, where brilliance is not harsh, but alive, fluid, and almost musical. He values diamonds that feel luminous even in the dimmest light, revealing their power not through ostentation but through harmony.

In an Arunashi creation, the round full cut diamond often becomes the axis, the central tone around which bolder shapes, colors, and ideas move. To Arun, it is proof that some forms achieve immortality not by resisting change, but by embodying balance so perfectly that no reinvention is required.
