

Diamond Taper Cut

A diamond taper cut is a step, cut shape that narrows from one end to the other, guiding the eye along its length like an arrow of light. Often used as side stones in high jewelry, its elongated trapezoidal form offers crisp geometry and a sleek transition between center stones and surrounding design elements.

Sourced from diamond, producing regions such as South Africa, Botswana, Canada, and Russia, the taper cut prioritizes clarity and reflection over scintillation, creating long, deliberate flashes that feel architectural and intentional.

The Story Behind Arun's Fascination for the Diamond : Taper Cut

For Arun, the diamond taper cut is all about movement and focus. Its shape acts like a visual compass, drawing the gaze from one point to another, creating a rhythm in the design. He values its ability to direct light and attention without overpowering the central stone, a supporting role that still carries its own quiet authority.

When selecting diamond taper cut, Arun looks for perfect symmetry, clean step facets, and a clarity that allows the shape's geometry to remain sharp and uninterrupted. He appreciates how the taper can subtly alter the mood of a piece, making it feel sleeker, more directional, and more deliberate.

In an Arunashi creation, the diamond taper cut becomes the gesture in the composition, the architectural line that moves the story forward. To Arun, it is proof that not all brilliance is about center stage; sometimes the most powerful beauty lies in guiding the eye exactly where it needs to go.
