

Trillion Cut

A trillion or trilliant cut, is a shape that thrives on tension and precision. With three equal sides, sharply defined corners, and a field of facets radiating from its center, it offers a visual architecture that feels both modern and elemental. Born from carbon crystallized deep within the earth's mantle and sourced from diamond, rich regions such as South Africa, Botswana, Canada, and Russia, the triangular cut refracts light in bold, directional flashes rather than the even sparkle of a round. Its geometry recalls ancient symbols of stability and ascension, yet in the hand it feels fresh, almost aerodynamic, a shard of brilliance shaped for movement.

The Story Behind Arun's Fascination for the Diamond : Trillion Cut

For Arun, the trillion cut diamond is the more sculptural, less an ornament than a piece of light caught in the act of taking form. Its three points give it a natural sense of direction, as if it's perpetually in motion, moving the eye through a design with deliberate intent.

When he selects a triangle diamond, Arun looks for stones where the cut is both crisp and balanced, allowing each facet to work like a mirror angled toward a different moment of light. He sees in it a symbol that can shift meaning, an arrow, a mountain peak, a fragment of a star, depending on the design it inhabits.

In an Arunashi creation, the trillion cut diamond becomes a point of focus and propulsion, a gemstone that doesn't just sit in place but drives the entire composition forward. To Arun, it's proof that geometry can carry emotion, that the sharpest shapes can still tell the softest stories, if you know how to set them.
